The objective of this project is to provide baseline data that can be used to support actions, decisions, and policy development to protect and enhance terrestrial and coastal ecosystems in the Coastal Douglas-fir (CDFmm) biogeoclimatic subzone. The maps were produced as a part of the TEAM project, to stratify land use in order to assess the potential ecological impacts of development. The maps are based on aerial photography and a number of other data sources. The maps illustrate terrestrial ecosystem distribution in the TEAM study area. The maps are presented at scales of 1:1,500,000 and 1:50,000. The maps are focused on the Nanaimo-Ladysmith-Gabriola Island region. The maps are designed to provide an overview perspective of the natural and non-forested ecosystems within the area. The maps are intended to be used for planning and decision-making purposes. The maps are currently being used by a number of organizations for a variety of purposes. The maps are available for download on the TEAM website.
