ILLECILLEWAET RIVER

Project No.	82 RPP 4
Previous Project No.	76 FDC 12

The field survey was carried out on June 17 and 18, 1982. Basically the project was a duplication of the survey done in June 1977.

Eleven cross-sections were done in the same location as 1977, (or as best we could, from photo identification). Iron bars were placed on both left and right banks on each section. Elevations were established by differential levelling from W.R.S. Mon 1071. Coordinates are arbitrary, a (H.P.) Hewlett-Packard 3800B distance meter, traverse joins each cross-section.

The longitudinal profile was established by Raytheon Depth Recorder Model 719B, located by the chainages established in 1977 (converted to metres).
