1. SUMMARY

Brown Paint Lake is located in the Kispiox Forest District, 59 km northwest of the town of Hazelton. Reconnaissance inventory of the lake was made July 27 - 29, 1996. The lake covers 27.0 surface hectares, is oblong and complex in shape and moderately deep (mean and maximum depths of 9.6 m and 22.1 m). It lies 730 m above sea level and drains via Brown Paint Creek to the Kispiox River in the Skeena watershed. Access was achieved by helicopter from Smithers. The closest road at time of survey was located 1.0 km northeast of the lake although road construction was planned within 200 m of the lake by the end of 1996.

During the survey the lake was thermally stratified. Dissolved oxygen was depleted in the hypolimnion but not to anoxia. The lake is neutral and has low specific conductance. Nitrogen and phosphorus concentrations indicate oligotrophy and N : P ratio suggests that phosphorus is likely limiting primary productivity. Chlorophyll *a* concentration in the surface water suggests very low phytoplankton standing crop.

The Brown Paint Lake fish community was sampled with two standard experimental multi-mesh gillnets (one floating and one sinking) and five Gee-type minnow traps baited with salmon roe. The inlet-outlet streams that were deep enough to support fish were sampled for fish presence by electrofishing. No fish were captured by any method during the survey. No signs of fish activity were seen. Chaoborids and amphipods found in the plankton at midday are highly indicative of fish absence in Brown Paint Lake.

The lake outlet and four inlets were examined for fisheries potential. Three inlets were too shallow for fish. Brown Paint Creek, upstream and downstream of the lake offers mostly riffle and run flow over cobble, boulder and bedrock substrates. Channel gradient adjacent to the lake is low (1-2 %) though it increases (7-14 %) further upstream and downstream of the lake. Brown Paint Creek contains some good spawning substrate upstream of the lake and would offer some excellent rearing habitat downstream of the lake.

The pleasant, pristine setting of Brown Paint Lake creates moderate aesthetic value. Timber harvest located in the catchment area is currently not visible from the lake surface. No evidence of recreational use of the Brown Paint Lake area was observed during the survey. Absence of fish is likely due to barriers downstream of the lake. This survey should satisfy resource agencies that the inlets and outlet of Brown Paint Lake are non-fish bearing streams under the Forest Practices Code. Special access management is not recommended.

2. INTRODUCTION

This document was prepared to fulfill requirements of Service Contract CSK 2043 between Joseph S. DeGisi and the Province of British Columbia for the term of July 22, 1996 to March 31, 1997. The contract was funded by Forest Renewal BC and administered by the Ministry of Environment, Lands and Parks, Fisheries Branch, Skeena Region.

The report presents the results of a reconnaissance level "Fish and Fish Habitat Inventory" of Brown Paint Lake 470-5259-01 performed to the current standards provided by the Resources Inventory Committee (RIC). Brown Paint Lake 470-5259-01 is located in the Kispiox Forest District, 59 km northwest of the town of Hazelton. A search of Ministry files revealed no previous survey of the lake and its tributaries. In addition to the lake inventory as per the contract terms of reference, inlets and the outlet were surveyed to 500 channel metres from the lake.

The field component of the survey was carried out by Joseph DeGisi (crew leader) and Chris Schell (assistant) July 27- 29, 1996. Chris Schell, Joe Jazvac and Jay Leopkey contributed to data compilation. Chris Schell and Joseph DeGisi co-authored this report. Stream cards, photographs and negatives, field notes, lab reports and all other materials associated with this survey were deposited with the Ministry of Environment, Lands and Parks, Fisheries Branch, Skeena Region.

4.2 Physical Data

Elevation	730 m	Elevation Source.....	NTS mapsheet
Water Surface Area.....	270084 m ²	Area Above 6 m Contour.....	95527 m ²
Lake Drainage Area	9.6 km ²	Flushing Time.....	211 days
Shoreline Perimeter	3136 m	Volume	2554417 m ³
Number of Islands.....	0	Perimeter of Islands	N/A
Maximum Depth	22.1 m	Mean Depth	9.6 m
Secchi Depth.....	8.0 m	Filterable Residue (T.D.S.)...	44 mg/L
Sounding Device	Lowrance X15B		

4.3 Benchmark

The benchmark was established in a 60 cm dbh spruce 6.0 m from shore, on the point that forms the north side of the bay at the northwest end of the lake. An iron spike was placed in an orange circle painted on the tree trunk, 2.15 m above the current lake level. The location of the benchmark is shown in Figure 2. The high water mark was located 10 cm above the current lake level.

4.4 Prior Surveys

A search of Skeena Region inventory files yielded no records for Brown Paint Lake, its outlet or inlets.

4.5 Lake Drainage

Quantitative characteristics of the stream surveys and fish sampling can be found on the stream survey forms in Appendix B and in Table 1. Numbering of the streams (C1, C2, etc.) in this section corresponds to labels on Figure 2 and other figures and tables in this report.

Five channels were examined.

- C1. Brown Paint Creek, WC 470-5929, inlet to the southeast shore of Brown Paint Lake at UTM 09.542015.6165234 (NAD27). Order 1, magnitude 1, drainage area 5.1 km², proposed classification S5. Several debris dams and chutes (1.0 m max. height) were observed, some of which would form seasonal barriers to fish passage. The channel bears mostly riffle flow over larges and bedrock substrate. Average gradient is 17 % and the channel is entrenched. Adjacent to the lake gradient is lower and bed material is predominantly gravels. Discharge was estimated at 0.04 m³/s. Electrofishing for 79 seconds captured no fish.
- C2. Unnamed channel (WC pending), inlet to the southwest shore of Brown Paint Lake at UTM 09.541575.6165550 (NAD27). Order 1, magnitude 1, drainage area 0.77 km², proposed classification S6. The stream is too shallow to constitute fish habitat and flow appears ephemeral. Discharge was estimated at 0.002 m³/s. Chutes (< 1.0 m max. height) would form seasonal barriers to fish passage. The channel bears riffle habitat over gravel and cobble. Visual observation during the survey detected no fish.

- C3. Unnamed channel (WC pending), inlet to the northwest bay of Brown Paint Lake at UTM 09.541150.6165950 (NAD27). Order 1, magnitude 1, drainage area 0.22 km², proposed classification S6. Channel bears intermittent and ephemeral flow over organic fines. The stream is too shallow to constitute fish habitat. Visual observation during the survey detected no fish.
- C4. Brown Paint Creek, WC 470-5929, outlet from the northeast shore of Brown Paint Lake at UTM 09.541650.6165935 (NAD27). Proposed classification S5. Two reaches are contained within the 500 m surveyed length of stream. Near the lake the channel gradient is low and much emergent vegetation grows in the organic fines bed material. Further downstream the channel steepens and carries riffle and run flow over cobble, boulder and bedrock substrates. Electrofishing for 202 seconds captured no fish.
- C5. Unnamed channel, WC 470-5929-390, inlet to the north shore of Brown Paint Lake at UTM 09.541400.6166025 (NAD27). Order 1, magnitude 1, drainage area 0.37 km², proposed classification S6. The channel drains the wetland north of the lake and bears intermittent and ephemeral flow over organic fines. Alder overgrow the channel in many places. The stream is too shallow to constitute fish habitat. Visual observation during the survey detected no fish.

The primary inlet, C1 contains good salmonid spawning substrate adjacent to the lake. The outlet channel, C4 would offer excellent rearing habitat in the upstream reach. Inlets C2, C3 and C5 are too shallow to constitute fish habitat.

4.6 Terrain and Vegetation

4.6.1 Immediate Shore

Shoreline substrate consists of large cobble, boulder and bedrock, covered by a thin layer of organic fines in sheltered areas. Immediate shoreline vegetation is a mix of *Equisetum fluviatile*, sedges (*Carex* sp.) and alder, with mature forest beginning above the high water line. Sweepers are abundant around the lake, impeding access to shore in many areas.

4.6.2 Surrounding Country

The lake is located in the Hazelton variant of the Moist Cold subzone of the Interior Cedar - Hemlock biogeoclimatic zone. Surrounding country consists of rolling hills sufficiently high to eliminate any distant views. The hills are forested with a mix of hemlock, fir and spruce. Terrain rises steeply to the south and features many rock outcrops.

5. ACCESS, DEVELOPMENTS AND LAND USE

5.1 Access

Access was achieved by Bell Long Ranger helicopter from Smithers, an air distance of approximately 140 km. The crew disembarked in a small wetland meadow, approximately 200 m northwest of the lake. The crew departed the lake from the same site.

5.2 Development and Land Use

5.2.1 Resorts and Campsites

The survey crew camped at the landing site, a wetland 200 m northwest of the lake. A rough trail was established to move equipment to the lake. No other campsites or cabins were observed.

5.2.2 Mining Claims

No evidence of mining claims or mineral exploration was observed at the lake. Omineca Mining Division four-post registration files for the locale showed no claims. No placer staking is allowed in this area of the province.

5.2.3 Timber Harvest

Cutblocks in the lake area were not visible from any vantage point on the lake surface. The lake lies within the Repap-Carnaby operating area in the Kispiox TSA. The closest existing cutblock to the lake lies 1.0 km to the northwest. The block was logged in 1994. Another cutblock located 100 m south of the lake was planned for 1996 but was not present at time of survey (see Figure 3). Flagging tape, possibly marking the cutblock boundary was observed during the survey of C1. This cutblock may be visible from the lake when harvested.

5.2.4 Waste Permits

A search of the provincial waste management database (WASTE) showed no active effluent permits in the watershed of Brown Paint Lake.

5.2.5 Water Permits

A search of Skeena Region water permit files yielded no records for Brown Paint Lake.

5.2.6 Obstructions and Pollutions

No obstructions or pollutions were observed by the survey crew. No sign of past or recent beaver activity was seen.

5.2.7 Recreation Resource Inventory

The latest Forest Service Recreation Resource Inventory for the Brown Paint Lake area was completed June 1994. IGDS-format coding for the polygon which includes the lake is:

X1E3

arD2

3

ROS status is thus "Semi-Private Motorized". Note that although the "feature-related recreational activity" code includes angling, no fish were captured in Brown Paint Lake during the survey.

5.2.8 Special Regulations and Restrictions

None known; none listed in the BC Freshwater Angling Regulations synopsis for 1996.

5.2.9 Comments

The pleasant, pristine setting creates moderate aesthetic value for Brown Paint Lake.

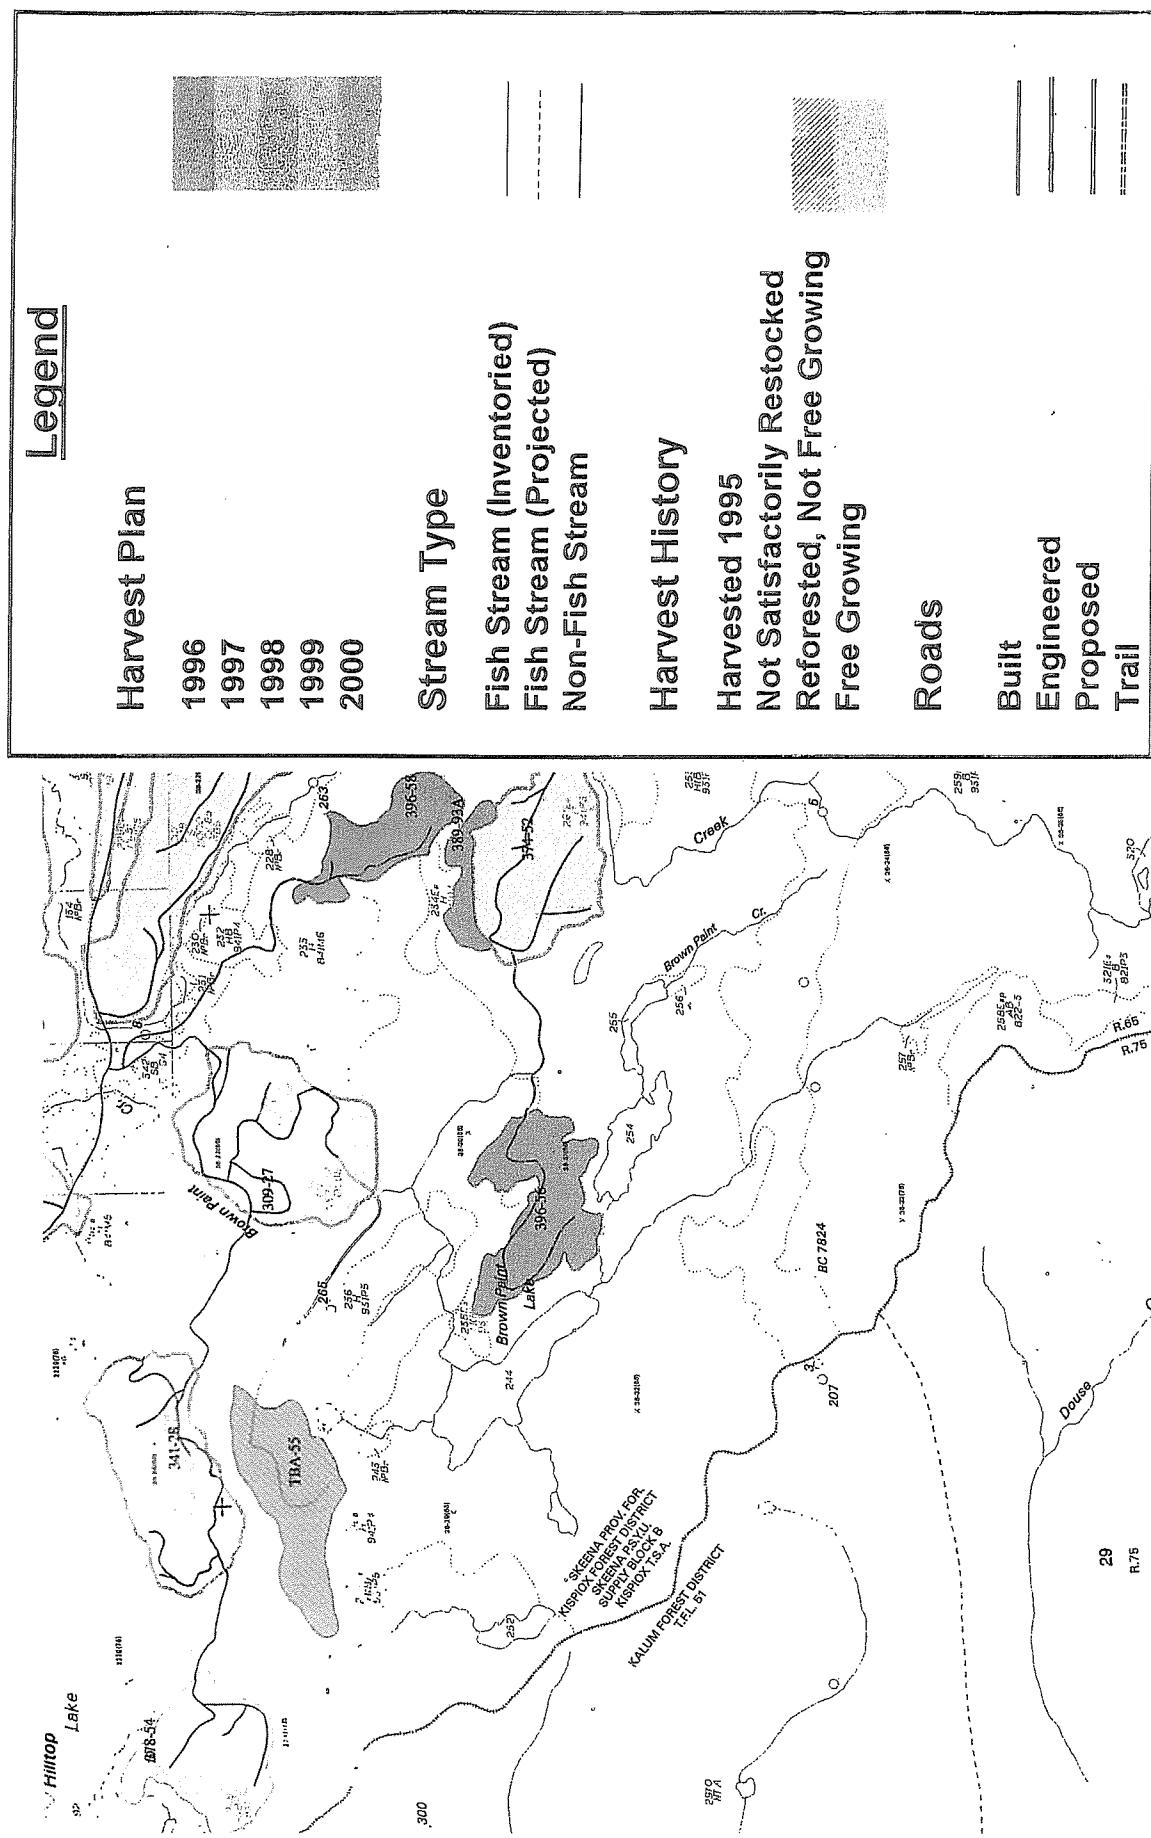

Figure 3. Planned cutblocks in the Brown Paint Lake area. Reproduced with permission from Repap - Carnaby.

6. FISH POPULATION SAMPLING

Details of fish population sampling in Brown Paint Lake and its inlets and outlet are given in Table 1. The raw data were recorded on the RIC standard "Fish Collection Method Information Form" which is reproduced in Appendix C. No fish were captured in Brown Paint Lake or its inlet-outlet streams. No signs of fish were seen.

Table 1. Fish sampling effort for all methods used at Brown Paint Lake and its inlet-outlet streams, July 27 - 29, 1996. **Water Body** gives the location where the gear was fished, where Lake = Brown Paint Lake; and C1, C2 etc. are streams numbered as in Section 4.5. **Date** is the date of set for gear fished overnight. **Capture Effort** gives the time in minutes for which the gear was deployed. **Depth** unit is metres. GN(S) and GN(F) = MOE / RIC standard experimental sinking and floating gillnets, length 91.2 m and depth 2.4 m with panels (in order) of 25, 76, 51, 89, 38, and 64 mm mesh. The sinking net set was made with the smallest mesh close to shore. See Figure 2 for exact set locations and orientation. MT = Gee-type minnow trap baited with salmon roe; EL = electrofishing; VO = visual observation.

Water Body	Capture Method	Site or Trap #	Date	Set Time	Haul Time	Capture Effort	Depth
Lake	MT	1	96/07/27	1350	1810	1700	0.5
Lake	MT	2	96/07/27	1355	1815	1700	1.5

C5	VO	1	96/07/28	-	-	-	-

7. LIMNOLOGICAL SAMPLING

Limnological sampling was conducted at midday on July 29, 1996 at the Brown Paint Lake limnology station labelled on Figure 2. The sky was mostly clear at time of survey and a very light westerly wind created calm surface conditions. Raw data and associated information were recorded on the RIC standard "Lake Biophysical Data Form" which is reproduced in Appendix D. Water samples were collected at 0.0 m, 7.5 m and 20.0 m depths, apportioned into aliquots for general chemistry and metals analysis, and shipped on ice to Zenon Laboratories for processing. Zenon's records show that the Brown Paint Lake samples were received on August 01, 1996, within the 72 hr RIC standard time frame for water sample transport.

7.1 Stratification

The oxygen - temperature profile of Brown Paint Lake on July 29, 1996 is shown in Figure 4. The lake was thermally stratified at time of survey. Dissolved oxygen was depleted in the hypolimnion but not to anoxia.

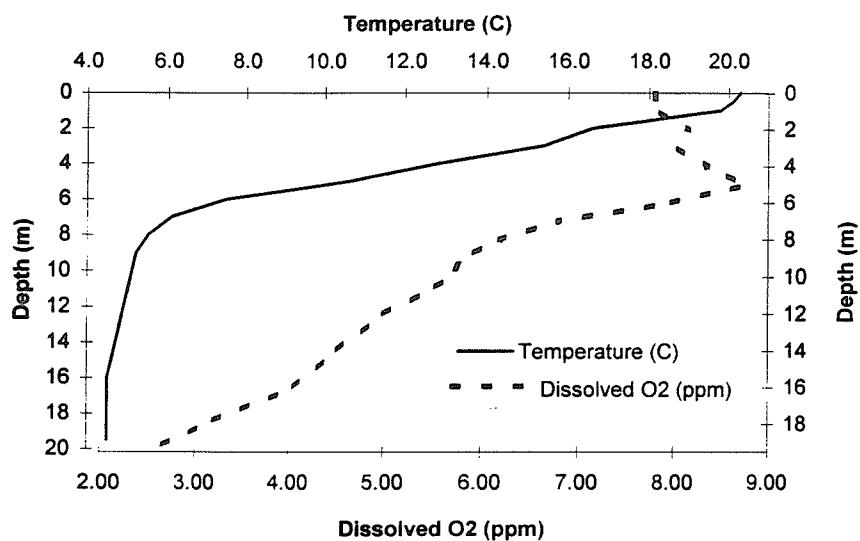

Figure 4. Temperature and dissolved O₂ profiles for Brown Paint Lake on July 29, 1996. The sampling device was a YSI 57 temperature/oxygen meter. Sample interval was 1.0 m from the surface to 12.0 m depth, and 2.0 m in deeper water.

Table 2. Water chemistry parameters estimated by Zenon Laboratories. Samples were collected at the limnology station labelled in Figure 2. Each sample was collected by a single cast of a 3.2 L non-metallic Van Dorn bottle on July 29, 1996 and received by Zenon on August 1, 1996. MDC = minimum detectable concentration for the analytic method.

Parameter	Shallow	Thermocline	Deep	Unit	MDC	Method

Phosphorus - Total	0.003	0.005	0.007	mg/L	0.003	Pres.Dig.Auto.Ascorbic A

7.2 Water Chemistry

Results of the general chemistry and metals analyses are given in Table 2 and Table 4. Brown Paint Lake is neutral with very low specific conductance and filterable residue. Lake water was clear at time of survey. Phosphorus and nitrogen concentrations imply ultra-oligotrophy and the estimated N : P ratio (Table 1) is greater than 15 : 1, indicating phosphorus is likely limiting primary productivity. Chlorophyll *a* concentration in the surface water suggested very low phytoplankton standing crop at time of survey.

Table 3. Estimated nitrogen : phosphorus ratio, and chlorophyll *a* concentration for surface water samples from Brown Paint Lake. All analyses were performed by Zenon Laboratories, except calculation of ratio. Suction was used to draw 1.0 L of sample water through a 0.45 μ membrane filter which was desiccated immediately after collection and shipped on ice to Zenon Laboratories for chlorophyll *a* extraction.

Parameter	Value	Unit	MDC	Method
Chlorophyll a	0.7	ug/L	0.5	Spectrophotometer
Nitrogen - Total	< 0.11	mg/L		Calculated result
Phosphorus - Total	0.003	mg/L	0.003	Pres. Dig. Auto Ascorbic Acid
N : P RATIO	< 37 : 1			Calculated result (total N / total P)

Table 4. Metals concentrations estimated by Zenon Laboratories. Sample collection is described in the caption to Table 2. All metals aliquots were fixed immediately after collection with 1 ml HNO₃ and subjected to HNO₃ digestion by Zenon. Analysis was performed using a Jarrell-Ash Model 61E (inductively coupled argon plasma analysis). MDC = minimum detectable concentration for the analytic method.

8. OTHER FLORA AND FAUNA

8.1 Aquatic Plants

Greater than 98 % of the lake surface is open water. *Nuphar polysepalum*, *Potamogeton richardsonii*, and *Hippuris vulgaris* were observed in moderate abundance in the bays. Identification references used for aquatic plants are listed in Appendix A.

8.2 Zooplankton

The Brown Paint Lake zooplankton community was numerically dominated by calanoid copepods. Chaoborids were also collected from the plankton and amphipods were seen swimming in open water at midday. The zooplankton taxonomic composition and size structure were typical of fishless lakes.

Table 5. Zooplankton collected by horizontal tow of a 150 μ mesh conical plankton net, Brown Paint Lake offshore, 1100 h. on July 29, 1996. Net mouth diameter was 30 cm and net length was 1 m. Tow duration was 2.0 minutes, at velocity of 0.38 m/sec and depth between 0 m and 2 m.

Taxa	No. / L	Max (mm)	Mode (mm)
Calanoida	7.3	1.1	0.7
Chaoboridae	0.5	5.5	2.8
Nauplii	1.0	-	-

8.3 Waterfowl and Other Fauna

Common loons were present on the lake at the time of survey. Osprey were seen soaring over the lake. No molluscs were found during the survey.

8.4 Summary of Rare and Endangered Species

No tailed frogs or harlequin ducks were observed during the survey.

9. MANAGEMENT COMMENTS

The pleasant, pristine setting of Brown Paint Lake creates moderate aesthetic value. Timber harvest in the lake's catchment area is not currently visible from the lake surface. No evidence of recreational use of the Brown Paint Lake area was observed during the survey.

The survey found no limnological explanation for fish absence from Brown Paint Lake. NTS mapsheet review found a section of Brown Paint Creek downstream of the lake with 31 % average gradient. Fish absence from the lake is likely due to barriers to fish passage in this section. This survey should satisfy resource agencies that the inlets and near-lake reaches of the outlet of Brown Paint Lake are non-fish bearing streams under the Forest Practices Code. Special access management is not recommended for the lake at this time.

10. PHOTOGRAPHS

Photograph 1. Aerial view of Brown Paint Lake, on approach from the south.

Photograph 2. View to the south from mid-lake.

Photograph 3. Upstream view of Brown Paint Creek, WC 470-5259, inlet to southeast end of Brown Paint Lake.

Photograph 4. Downstream view of Brown Paint Creek, WC 470-5259, outlet of Brown Paint Lake.

Photograph 6. Upstream view of C3 (WC pending), inlet to northwest bay of Brown Paint Lake.

Photograph 5. Upstream view of C2 (WC pending), inlet to southwest shore of Brown Paint Lake.

APPENDIX A. ABBREVIATIONS AND OTHER NOTES

MOE = Ministry of Environment, Lands and Parks

RIC = Resources Inventory Committee

TSA = Timber Supply Area

UTM = Universal Transverse Mercator

WC = Watershed Code

WCD = Watershed Code Dictionary

NTS = National Topographic Survey

NAD27 = North American Datum 1927

Note: UTM values were derived from two sources:

1. For lakes, UTM at the outlet was obtained from the WCD, and this is noted after the UTM.
2. For streams, UTM at the point they enter/exit the lake was estimated from NTS 1:50,000 mapsheets, using interpolation. UTM datum year (i.e. NAD27) is recorded after the estimate.

NTS 1 : 50,000 scale mapsheets were used to determine lake drainage area, stream order, stream magnitude and stream drainage area. Corrections were made for NTS mapsheet inaccuracies noted during the survey.

Native land claims information was derived from the following source:

“Native Land Claims in Skeena Region.” Skeena Region GIS. Ministry of Environment Lands and Parks. February 1995. Map scale 1 : 1,500,000.

All information from the above source was confirmed current as of February 1997 by the following first nation band council offices: Gitanyow Hereditary Chiefs

Gitxsan Hereditary Chiefs
Lake Babine Nation (Nat’oot’en)
Wet’suwet’en Nation
Nisga’a Nation

Aquatic plants were identified using the following sources:

Brayshaw, T.C. 1985. Pondweeds and bur-reeds, and their relatives, of British Columbia. British Columbia Provincial Museum No. 26 Occasional papers series.

Pajar, J. and A. MacKinnon. 1994. Plants of coastal British Columbia including Washington, Oregon and Alaska. B.C. Ministry of Forests and Lone Pine Publishing.

Warrington, P.D. 1994. Identification keys to the aquatic plants of British Columbia. Resources Inventory Committee Report 029. Discussion Document.

The contractor assigned a reference number of 9628 to Brown Paint Lake 470-5259-01. This number appears in field notes and other contractor records associated with this survey.

NF		

Obstructions

Obstruction Type	Distance from Stream mouth	Distance from El. 0
	1	X

Comments

- 1 Several 1 m high debris jams and 1 m high cascades are present as barriers within the channel, they are potentially passable by fish at high flows
- 2 74 sec of electrofishing yielded no fish, the lower 200 m (u/s of the lake) offers good salmonid spawning potential, and fair rearing potential, while the upper 300 m (w/s of the lake) offers fair to poor salmonid spawning and rearing potential
- 3 The first 200 m w/s from the lake has a more gravelly substrate, higher cover, and a lower gradient, the survey applies to the upper 300 m u/s of the lake
- 4 All distances estimated by ground estimate

Obstructions

Location	Obstruction Type	Description

Comments

- 1 A few drops and falls of less than 1 m are present. These would likely be passable at higher flow stages. Stream is too shallow to comprise fish habitat, and may be intermittent in flow.
- 2 Moss covered rock occurs along the banks. Near the lake where the gradient is lower, bank composition is fines.
- 3 All distances estimated by ground estimate.

Obstructions

OBSTRUCTIONS		TYPE OF OBSTRUCTION		LOCATION	

Comments

- 1 Two reaches encountered: the first is a low gradient reach extending from the lake to 250 m d/s, characterized by organic fines substrate and emergent vegetation, with excellent rearing and poor spawning potential; in the second, starting at 250 m d/s of the lake, stream characteristics change and are represented by the survey data. The lower reach consists of poor spawning and rearing habitat
- 2 207 sec of electrofishing yielded no fish
- 3 All distances estimated by ground estimate

Watershed Update

Observations

INF 1 J VO

Comments

- This channel carries intermittent flow to Brown Paint Lake from the wetland and small pond north of the lake. Much of the channel is overgrown by alder. The substrate is organic debris and fines. The stream is certainly seasonal and too shallow to provide fish habitat.

Project Information :

Project ID : BROWN PAINT LAKE
Submitted By : JOE DEGISTI

Requisition Forms :

Form 06111187 logged on 1-Aug-96 completed on 17-Aug-96

Remarks :

- All organic data is blank corrected except for PCDD/F, Hi-res MS and CLP volatile analyses
- 'MDC' = Minimum Detectable Concentration, '<' = Less than MDC, '---' = Not analyzed
- Solids results are based on dry weight except Biota Analyses & Special Waste Oil & Grease
- Organic analyses are not corrected for extraction recovery standards except for Isotope Dilution methods, (i.e. CARB 429 PAH, all PCDD/F and DBD/DBF analyses)
- All Groundwater samples are decanted and/or filtered prior to analysis

Methods used by Zenon are based upon those found in 'Standard Methods for the Examination of Water and Wastewater', 18th Edition, published by the American Public Health Association, or on US EPA protocols found in the 'Test Methods For Evaluating Solid Waste, Physical/Chemical Method, SW846', 3rd Edition. Other procedures are based on methodologies accepted by the appropriate regulatory agency. Methodology briefs are available by written request.

All work recorded herein has been done in accordance with normal professional standards using accepted testing methodologies, quality assurance and quality control procedures except where otherwise agreed to by the client and testing company in writing. Any and all use of these test results shall be limited to the actual cost of the pertinent analysis done. There is no other warranty expressed or implied.
Your samples will be retained at Zenon for a period of 30 days from receipt of data or as per contract.

Drainage :

Accessed by JET RANGER from SMITHERS

Details

(Road: surface condition; directions; odometer distances; Air: mode, distance, flight path, time, disembarkment point)

Physical Data and Sources

Elevation _____ m

Elevation Source _____

Sounding Device _____

Benchmark

The benchmark was established in a 60 cm dbh SPRUCE located _____
6m FROM SHORE ON COINT DELIMITING NORTH SIDE OF
BAV AT EXTREME WEST END OF LAKE.

An iron spike was placed in an orange circle painted on the tree trunk, 2.15 m above the current lake level. The high water mark was located 10cm m above the current lake level.

Terrain and VegetationImmediate shore

(shoreline substrates; immediate shoreline vegetation; transition to forest; wetland locations; sweepers)

[- EQUSETUM AQUATILIS NUPAR POLYSEPARUM, OTAMOGATON RICHARDSONI
 'COON'S TAIL' SEDGES CAREX spp.]

- SHORELINE SUBSTRATE LARGE COBBLE BOULDER, AND BEDROCK WITH AREAS OF ORGANIC FINES.
- ALDER AND SEDGE ABUNDANT ON IMMEDIATE SHORELINE, MATURE FOREST TO HIGH WATER LINE
- SHORELINE CHARACTERISED BY SWEEPERS

Surrounding country

(terrain; forest cover; cliffs / rock outcrops / meadows; mountains or other visible features)

- HEMLOCK, FIR, SPRUCE, MIXED MATURE FOREST WITH ALDER ON SHORE
- TERRAIN RISES STEEPLY ON SOUTH SIDE OF LAKE SAME ROCK OUTCROPS
- ROLLING HILLS SURROUND LAKE, NEAR VIEW OF STEEP FORESTED HILL TO THE EAST OF LAKE.
- NO FAR VIEWS.

Aquatic macrophytes

(types, relative abundance, location of beds)

- EQUSETUM + SEDGES ON MUCH OF SHORE, N. POLYSEPARUM,
P. RICHARDSONI, COON'S TAIL IN. BAVS. AS WELL.
- HIGHEST CONCENTRATION OF MACROPHYTES IN BAYS.

Development and Land Use

Campsites or cabins NONE

Timber harvest

(locations visible from lake: along inlets or outlet)

- NO SIGN OF TIMBER HARVESTING FROM LAKE SURFACE.
- FLAGGING TAPE MARKING CUTBLOCK ON NORTH SIDE OF C1, 400 m UPSTREAM FROM LAKE.

Mining claims, trapping or other human activity

NONE VISIBLE.

Obstructions and pollutions

(beaver dams; beaver activity; other obstructions - waterfalls, cascades, etc. near the lake)

OLD BEAVER SIGN NEAR C3; NO DAMS.

NO WATERFALLS CLOSE TO LAKE.

Comments, including fish population / angling quality

(trails; aesthetics; fish condition/ appearance; other features/charcteristics of interest not previously mentioned)

NICE LAKE. VERY PLEASANT. NO FISH

- SWEEPERS MAKE NAVIGATION NEAR SHORELINE DIFFICULT.
- AMPHIPOD SEEN SWIMMING PELAGICALLY, MID DAY
- PLANKTON HAUL - 2 MINS, 0.38 m/s, 30cm DIAM. NET OPENING, 11:00.

Channel bears an intermittent stream, substrate organic fines and debris, low gradient, too shallow and temporary to serve as fish habitat

<p>This channel carries intermittent flow to Brown Paint Lake from the wetland and tiny pond north of Brown Paint Lake. Much of the channel is overgrown by alder. The substrate is organic debris and fines. The stream is definitely seasonal and too shallow to provide fish habitat.</p>
