

IDFdk1

THOMPSON DRY COOL INTERIOR DOUGLAS-FIR VARIANT

Distribution: The IDFdk1 variant is widespread throughout the South Thompson Upland, Okanagan Range, Pavillion Ranges and southern part of the North Thompson Upland ecosections. This variant occupies the heart of the former Kamloops Forest Region's "Drybelt". It occurs at mid elevations from the Fraser River between Lytton and the Bridge River and the leeward slopes of the Cascades to Okanagan Lake. It also extends from the the US board north to Pavillion Lake and Heffley Creek including the North and South Thompson watersheds down stream of Heffley Creek and Chase respectively. The IDFdk1 also occurs in the Guichon, Nicola, Similkameen, Ashonola drainages and several small drainages west of Okanagan Lake.

IDFdk1 - 1

Elevational Range (Mean): The elevation range of the IDFdk1 is **highly variable**. The upper elevation limits are highest in the Pavilion and Okanagan Ranges. It generally starts above the IDFxh1 or IDFxh2 at approximately 1200-1300m on north aspects and 1300-1450 on steep south aspects. It extends upslope to the MSxk or MSdm2 at about 1400-1500 m on north slopes and 1450-1600 m on steep south aspects.

Climate: The IDF zone is characterized by a warm, dry climatic regime with a relatively long growing seasons. Soil moisture deficits are common, particularly on south aspects. The IDFdk1 is cooler than the IDFdm, xh, xm, xw and mw. It is slightly cooler than the IDFdk2 but likely warmer than the IDFdk3 or dk4. It has an intermediate precipitation regime when compared to other IDF biogeoclimatic units. The mean annual precipitation ranges between 38 and 51 cm, most of which falls in mid winter and late spring. Snow cover is generally continuous between late November and April but rarely exceeds 75 cm and more typically peaks around 50 cm. Late August soil moisture deficits are the most important climatic factor limiting forest productivity in this variant.

Forest Cover: Much of the IDFdk1 landscape is composed of mature seral stands of Fd and PI. PI becomes more dominant at higher elevations and in areas subject to cold air drainage. Py if often present on drier sites, particularly on south aspects at lower elevations. Sxw and BI occur on wet sites and floodplains generally have Act, Sxw and Ep. Aspen often occurs in isolated patches on mesic to subhygric sites. Wildfires are common and tend to result in mixed severity burns. As a result, isolated individuals or small patches of Fd and/or Lw vets remain in many stands as a testament to their fire resistance. Climax stands of Fd or Fd/Py are relatively common on steep southern exposures where the forests tend to be more open and less susceptible to stand-destroying wildfires. In contrast mesic to submesic sites tend to experience stand-destroying events followed by a relatively short regeneration cycle that results in relatively even-age stands. Stand productivity is slightly higher in the IDFdk1 than the IDFxh1 and slightly lower than the IDFmw. Site index for Fd averages 15-17 on zonal sites and is often 1-2 meters greater for PI.

Zonal Vegetation and Soils: Mature seral stands are dominated by Fd and varying amounts of PI. Fd is the principle tree species regenerating in the understory. Shrubs are poor to moderately well developed and consist of birch-leaved spirea, soopolallie and rose. The well developed herb layer is dominated by pinegrass and includes kinnikinnick, wild strawberry, twinflower, showy aster and heart-leaved arnica. Moss cover is moderate and includes red-stemmed feathermoss, heron's-bill moss, ragged moss and pelt lichens. Soils are Dystric or Eutric Brunisols with a Mor or Moder humus form.

IDFdk1 - 2

Adjacent Biogeoclimatic Subzones: The IDFdk1 occurs above the IDFxh1 or IDFxh2 and below the MSxk or dm2. The IDFdk2 and dm1 occur at similar elevations in areas adjacent to the IDFdk1.

Distinguishing adjacent Biogeoclimatic units from the IDFdk1

IDFhx1 and hx2

- Py is more common on drier sites
- Pl is absent
- prince's pine, soopolallie, and falsebox are less common
- rough fescue and Idaho fescue are more common on dry sites
- grasslands occur more frequently across the landscape

IDFdm1

- Lw is common in successional stands
- grasslands are uncommon across the landscape
- falsebox and prince's pine are more common

IDFdk2

- falsebox is more vigorous and common (usually greater than 1-2% cover on zonal sites)
- grasslands are uncommon across the landscape
- prince's pine and one-side wintergreen are more common

IDFmw1 and ICHdw2

- Cw and Ep are usually present on mesic sites
- Hooker's fairybells, baldhip rose and sarsaparilla are common
- pinegrass is absent or has low cover on zonal sites
- kinnikinnick is restricted to drier site series

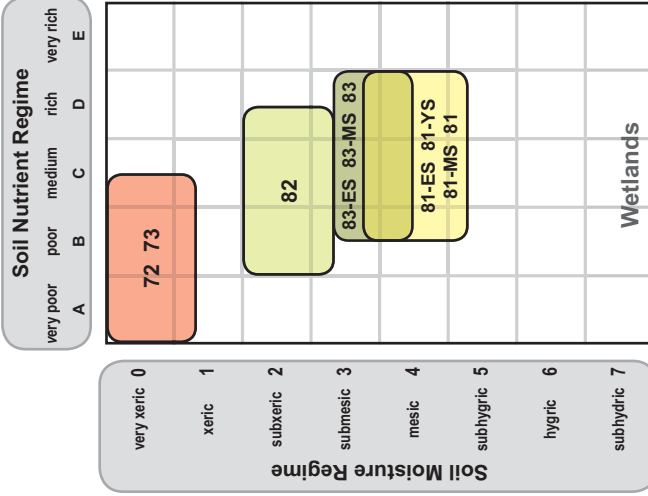

MSdm1

- Sxw and Bl are common on zonal sites
- black huckleberry is present
- grouseberry, arctic lupine and bunchberry are more common and widespread across multiple site series

ICHmk1

- Cw, Sxw and Bl common on zonal sites
- Hooker's fairybells, queen's cup, baldhip rose and sarsaparilla common

¹ Most common at upper elevations.
² Often associated with grasslands.

82 Bluebunch wheatgrass — Junegrass

This grassland unit is common. It occurs on steep and warm or gentle middle and upper slopes and crests. The herb layer is often dominated by bluebunch wheatgrass (>10%). Other common herbs include arrowleaf balsamroot, timber milk-vetch, june grass, parsnip-flowered buckwheat and Kentucky bluegrass. Mosses and lichens are sparse and include sidewalk moss and clad and pelt lichens.

**83-ES \$Big sage — Kentucky bluegrass**

This early seral unit is uncommon. It usually occurs on the Douglas Lake plateau on middle and upper slopes. Big sagebrush dominates the vegetation. Other common species include Kentucky bluegrass, sweet-scented bedstraw, silky lupine and parsnip-flowered buckwheat. Mosses and lichens are sparse to absent.

**83-MS \$Big sage — Bluebunch wheatgrass**

This mid-seral unit is uncommon. It usually occurs on the Douglas Lake plateau on middle and upper slopes. Like the 83-ES unit, big sagebrush dominates the vegetation. However, it differs in that bluebunch wheatgrass is very abundant (>10%) and usually dominates the herb layer. Other common species include arrowleaf balsamroot, junegrass, sweet-scented bedstraw, Idaho fescue and pinegrass. The moss and lichen layer includes tufted thread-moss, sidewalk moss and clad and pelt lichens.

**83 Idaho fescue — Bluebunch wheatgrass**

This site series is uncommon. It usually occurs on the Douglas Lake plateau on middle and upper slopes. It lacks big sagebrush which characterizes younger successional stages. The herb layer is dominated by a mix of Idaho fescue and bluebunch wheatgrass. Other common species include junegrass, parsnip-flowered buckwheat, Kentucky bluegrass, silky lupine and Sandberg's bluegrass. Mosses and lichens are sparse and include tufted thread-moss, sidewalk moss and clad and pelt lichens.

81-ES \$Spreading needlegrass — Bluebunch wheatgrass

This early seral unit is common and occurs on gentle middle and upper slopes and level areas. The herb layer is dominated by abundant spreading needlegrass (>10%). Other common herbs include arrowleaf balsamroot, junegrass and Sandberg's bluegrass. The sparse to moderate moss and lichen layer includes clad and pelt lichens.

**81-YS** \$Kentucky bluegrass

This young seral unit is common and occurs on gentle middle and upper slopes and level areas. The herb layer is dominated Kentucky bluegrass. Other common species include silky lupine, old man's whiskers, crested wheatgrass, wildrye, spreading needlegrass and yarrow. Mosses and lichens are sparse to absent.

**81-MS** \$Kentucky bluegrass — Rough fescue

This mid-seral unit is common and occurs on gentle middle and upper slopes and level areas. It is similar to the 81-YS unit in that Kentucky bluegrass is very abundant but differs in that rough fescue is also very abundant (>20%). Other common herbs include silky lupine, old man's whiskers, showy pussytoes, wildrye and spreading needlegrass. Mosses and lichens are sparse to absent.

**81** Rough fescue

Undisturbed zonal sites are found infrequently and therefore the zonal site series is less common than its successional counterparts. They occur on undisturbed, gentle middle and upper slopes and level areas. The vegetation is dominated by rough fescue (>20%) and lacks the Kentucky bluegrass that is characteristic of the 81-MS and 81-YS units. Other common species include junegrass, old man's whiskers, Sandberg's bluegrass, spreading needlegrass and yarrow. The moss and lichen layer is sparse to moderate and includes sidewalk moss and clad and pelt lichens.

72 Juniper — Rocktripe lichens

This talus unit is very uncommon. It occurs on warm and steep middle and upper slopes. The substrate is composed of rocks and boulders. Trees are largely absent except for stunted, scattered At. The sparse shrub layer includes falsebox, Rocky Mountain juniper and common juniper. The herb layer is very sparse; the most common species are mountain cliff fern and pinegrass. The moss and lichen layer is sparse to moderate and includes rocktripe, clad and pelt lichens.

**73 Selaginella — Clad lichens**

This unit is uncommon and is found on steep or gentle upper slopes and crests where soils are very shallow and exposed bedrock is present. Fd may occur as scattered individuals (<10%). The shrub layer is typically sparse and includes common juniper and birch-leaved spirea. The herb layer is sparse to moderate; the most common species include bluebunch wheatgrass, junegrass, yarrow, round-leaved alumroot, compact selaginella, kinnikinnick and shrubby penstemon. The sparse to moderate moss and lichen layer includes sidewalk moss, clad and pelt lichens and awned haircap moss.

**02 Fd — Juniper — Kinnikinnick**

This unit is uncommon and is found on steep or gentle upper slopes and crests where soils are very shallow and exposed bedrock is present. Sparse Fd dominates the forest canopy (>10%) and regeneration layer. The shrub layer is sparse and common juniper is usually the most common and abundant species. The herb layer is sparse to moderate; pinegrass is usually the most abundant species. Other common species include round-leaved alumroot, compact selaginella, kinnikinnick and shrubby penstemon. The moss and lichen layer is sparse to extensive; common species include sidewalk moss, clad, pelt and rocktripe lichens, juniper haircap moss and heron's-bill moss.

**03 Fd — Bluebunch wheatgrass — Pinegrass**

This unit is common and is found on warm and steep middle and upper slopes. The tree layer and sparse regeneration layer are dominated by Fd. The sparse to moderate shrub layer includes Rocky Mountain juniper, common juniper, birch-leaved spirea and common snowberry. Unlike all other units, bluebunch wheatgrass is common and is usually the most abundant species in the extensive herb layer. Other common species include yarrow, pinegrass, kinnikinnick and shrubby penstemon. Mosses and lichens are sparse to absent.

04 Fd — Pinegrass — Kinnickinnick

The 04 unit is common and is found on gentle or steep and warm middle and upper slopes. The forest canopy and sparse to moderate regeneration layer consist of Fd. The shrub layer is sparse to moderate and includes common juniper, birch-leaved spirea, soopolallie and rose. The herb layer is extensive and, unlike drier units, is dominated by abundant pinegrass (>10%). Other common species include kinnickinnick, showy aster, timber milk-vetch, wild strawberry and racemose pussytoes. Bluebunch wheatgrass is very sparse or absent. The sparse to moderate moss and lichen layer includes ragged-moss and clad and pelt lichens.

**05 FdPI — Pinegrass — Grouseberry**

This unit is common, particularly at upper elevations. It occurs on gentle middle slopes and level areas. Unlike all other units, PI usually dominates the tree layer although Fd may also be abundant. Both species occur in the regeneration layer. The sparse to moderate shrub layer includes birch-leaved spirea, soopolallie, falsebox, and rose. The extensive herb layer differs from all other units in that both pinegrass and grouseberry are the most common and abundant species. Other common species include kinnickinnick, wild strawberry, arctic lupine, heart-leaved arnica and twinflower. Mosses are sparse to moderate and are often dominated by red-stemmed feathermoss. Ragged-moss and heron's-bill moss are often present.

**01-YS \$At — Rose — Pinegrass**

This early seral unit is very uncommon and is found on steep and cool or gentle middle and lower slopes and level areas. The forest canopy is dominated by At. The sparse regeneration layer may contain PI, Sxw or At. The moderate shrub layer includes birch-leaved soopolallie, rose and common snowberry. The extensive herb layer is dominated by pinegrass (>10%). Other common herbs include kinnickinnick, wild strawberry, heart-leaved arnica, twinflower and one-sided wintergreen. Mosses and lichens are sparse to absent.

**01 FdPI — Pinegrass — Feathermoss**

The zonal site series occurs on steep and cool or gentle middle and lower slopes and level areas. The forest canopy is dominated by Fd with a minor PI component. Regeneration is sparse and dominated by Fd. Shrubs include birch-leaved spirea, soopolallie and rose. The extensive herb layer is dominated by pinegrass (>10%); other common herbs include kinnickinnick, showy aster and wild strawberry. Unlike the 04 unit, heart-leaved arnica, twinflower, one-sided wintergreen and rattlesnake-plantain are also frequently present. The moderate to extensive moss and lichen layer is usually dominated by red-stemmed feathermoss. Other common species include heron's-bill moss and ragged-moss.

06-ES \$At — Kentucky bluegrass

This early seral unit is very uncommon and is most often associated with grasslands. It is found on gentle lower and toe slopes, gullies and level areas. At dominates the forest canopy. The sparse shrub layer contains rose and common snowberry. The herb layer is dominated by abundant Kentucky bluegrass (>20%). Clover, yarrow, sweet-cicely and yarrow may also be present. Mosses and lichens are sparse to absent.

**06-YS \$At — Snowberry — Rose**

This young seral unit is very uncommon and is most often associated with grasslands. It is found on gentle lower and toe slopes, gullies and level areas. At dominates the forest canopy. A minor amount of Sxw may also be present. The shrub layer is extensive; it contains common snowberry, rose, soopolallie and Sitka alder. The extensive herb layer differs from other At-dominated units in that Kentucky bluegrass and pinegrass are sparse to absent. Instead, common species include western meadowrue, star-flowered false Solomon's-seal, sweet-cicely and baneberry. Mosses and lichens are sparse to absent.

**06 SxwFd — Gooseberry — Feathermoss**

The 06 unit is very uncommon and is typically associated with grasslands. It occurs on gentle lower and toe slopes, gullies and level areas. At is sparse to absent and the forest canopy is dominated by Sxw and Fd. Pl is sometimes present. The sparse to moderate shrub layer includes black gooseberry, common snowberry and rose. The moderate to extensive herb layer differs from drier units in that pinegrass is sparse to absent; common species include heart-leaved arnica, twinflower, one-sided wintergreen, rattlesnake plantain, sweet-cicely, bunchberry and baneberry. The moderate to extensive moss layer includes red-stemmed feathermoss, heron's-bill moss, knight's plume and step moss.

**07 ActSxw — Dogwood**

This unit is very uncommon. It is found on level areas and gullies where seepage is present. The tree layer is variable; Sxw or Act may be dominant species. The extensive shrub layer includes abundant red-osier dogwood and Douglas maple. Other common species include black gooseberry, mountain alder and rose. The herb layer is sparse; common species include common horsetail, sweet-scented bedstraw and star-flowered false Solomon's-seal. Mosses and lichens are sparse to absent.

08 Sxw — Horsetail

This uncommon unit is found on level areas and depressions where the water table is at or near the surface area. The forest canopy differs from all other units in that it is dominated by Sxw. The shrub layer is highly variable; common species include rose, black gooseberry and red-osier dogwood. The extensive herb layer is dominated by abundant common horsetail (>10%). Other common species include twinflower, sweet-cicely and star-flowered false Solomon's-seal. Mosses and lichens are sparse to absent.
